ACKNOWLEDGEMENT

This thesis is the result of not only my own endeavor, but also the sincere guidance, inspiration and assistance of many, to all of whom I am deeply grateful.

First of all, I would like to express my gratitude to my supervisor, Professor Jeremy Seymour Eades, for his guidance during the project and all throughout my APU days. He has been an astute guide in academic matters as well as an inspirational teacher and a mentor in life. I shall always lack the appropriate words to thank him. No matter whatever time and whatever issue I wanted to discuss, he had time for me always, and without his valuable inputs, this thesis would have been impossible to complete. I am thankful to have enjoyed his supervision.

Next, I shall like to express my sincerest gratitude to Professor AVM Mani. He has also been an inspirational teacher and I learnt many of the theoretical frameworks used in this thesis from him in his class on the Changing Social Landscapes in the Asia Pacific.

I would also like to express my gratitude to Professor Ko Yiu-Chung for his immensely valuable guidance on research methods and design. I hope I could utilize the knowledge gained from his teaching in this thesis.

Apart from my supervisor and other teachers, I have benefited from the vibrant interaction among many friends and seniors of mine, some of whom have already graduated from APU now. I have also been immensely assisted all along by the APU Library staff; who made me feel at home in the library all the time. I would also like to thank Ms Emiko Oonk Tachikawa of APU Academic Office for
her careful guidance regarding official matters.

This thesis is the result of nearly a month long intensive fieldwork in the villages by the Ajoy River in India. I am deeply indebted to Mr. Harun Rashid for his invaluable assistance during my fieldwork trips. He not only helped me to reach the villages in the Ajoy River basin and talk to the villagers, but also shared his knowledge of the area with me. Without his sincere cooperation, this research could not have been complete.

This thesis is also the culmination of my graduate studies at Ritsumeikan APU, which was made possible by the sheer will, support and love of my mother, Ms Mitali Chakravarty. I wish to express my thanks for her support.

Lastly, but not the least, I wish to thank my brother, Mr. Shamik Chakraborty, for everything. He had taken care of the household when I was writing the thesis and have assisted me in every possible way. During my fieldwork trip in India, I was immensely assisted by his presence not only as a brother, but also as a geographer. His insightful comments on many issues have made it possible for me to understand them better.
DECLARATION OF ORIGINALITY

I, Chakraborty Abhik, declare that this thesis is an original work of mine and that it has not been submitted to any other institution or committee for the purpose of any other degree than mentioned here. Sections of works, ideas or information derived from publications by other authors or any media sources have been properly cited and referenced wherever used.
ABSTRACT
The Bengal basin, formed by geomorphic processes carried out by three mighty rivers of the Indian subcontinent, is home to 60 percent of freshwater resources in India. Recently, it has seen a grave threat emerge from the impact of rapid industrialization and urbanization, threatening to jeopardize the rich ecosystems and sociocultural variation in this area. The region is crisscrossed by many tributaries of the river Bhagirathi Hooghly and Ajoy is one of the main rivers in this area. This research, by analyzing the continuity and transformation in the social landscape in the Ajoy River basin, explores issues like the relationship between the river and bank dwellers, how the bank dwellers perceive the anthropogenic changes in the river regime, and to what extent are they involved in these changes. It argues that natural events such as floods have a social dimension, which makes them socially constructed phenomena at the same time. The findings indicate that ‘flood’ is a complex and dynamic entity of natural, socioeconomic and sociopolitical components. As the river has shifted its course, floods have devastated bank-dwelling communities repeatedly. In addition, a lack of information about the river’s characteristics has led to dangerous ignorance on the part of the people engaged in construction activities and bank-dweller communities increasingly dependent on the urban centers for their incomes. The research concludes that the twin processes of urbanization and globalization are the main drivers of change in the local landscape, and the bank dwelling communities have little say in such changes taking place around them but are forced to cope with them due to their marginalized existence. Urban expansion in the river basin has disentitled these communities dependent on the river by removing their control over its water resources. The case of this river basin points to a fundamental change in the man-nature relationship, and a loss of indigenous knowledge or cultural diversity, which used to be extremely rich in historical times.

Key Words: social landscape, man-environment relationship, anthropogenic changes, social dimension of flood, urbanization and globalization, loss of cultural diversity.
